PROBLEM

Forest fires are a major environmental issue, creating economic and ecological damage while endangering human lives.

There are typically about 100,000 wildfires in the United States every year. Over million acres of land have been destroyed due to treacherous wildfires. It is difficult to predict and detect Forest Fire in a sparsely populated forest area and it is more difficult if the prediction is done using ground-based methods like Camera or Video-Based approach and also using satellites.

Key rules of brainstorming

Stay in topic.

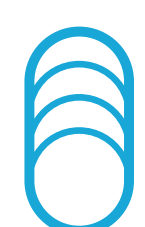

Encourage wild ideas.

Defer judgment.

Listen to others.

Go for volume.

If possible, be visual.

To run an smooth and productive session
